

THE SMALL COFFEE BREWING GUIDE

Good coffee is mostly about three things: fresh beans, the right grind, and the ratio of coffee to water. This guide keeps it simple and covers two easy brewing methods you can do at home without fancy machines.

THE GOLDEN RATIO

A reliable starting point is 60 grams of coffee per litre of water, which is about two tablespoons of ground coffee per cup. Adjust to taste: more coffee for a stronger cup, less for a milder one.

THE FRENCH PRESS

Grind the beans coarse, like sea salt. Add the grounds and pour water just off the boil, around 95 degrees Celsius. Stir once, put the lid on, and wait four minutes. Then press the plunger down slowly and serve straight away so it does not turn bitter.

THE POUR-OVER

Use a medium grind and a paper filter. Pour a little water first to wet the grounds and let them bloom for 30 seconds, then pour the rest in slow circles. The whole brew should take about three minutes.
